

**Q. Compare your procedural C version and OOP TaskList version: List 3 problems you faced in the C version that were solved by using classes and methods in the OOP version.**

**1. Managing task data**

- In the C version, we used separate arrays like `tasks[]` and `status[]` to store task information.
- In the OOP version, the `Task` class keeps the task title and status together in one object.

**2. Marking a task as done**

- In the C version, we needed a separate function and status array to change the task status.
- In the OOP version, the `markDone()` method directly changes the `isDone` property of a `Task` object.

**3. Managing multiple tasks**

- In the C version, adding, updating, and displaying tasks required separate loops and variables.
- In the OOP version, the `TaskList` class provides simple methods such as `addTask()`, `markTaskDone()`, and `showTasks()`, making the program easier to organize and maintain.
